**List of plant-feeding sawflies by their host plant associations in Hungary
(Hymenoptera: Symphyta)**

Abstract – A list of host plants and associated plant-feeding species of wasps (Hymenoptera) belonging to the paraphyletic group Symphyta (sawflies and their allies) is presented based predominantly on the author's handbooks published in the book series Fauna Hungariae. The tribe Nematini (Tenthredinidae) is excluded. 420 host plant taxa and the associated 1115 host records of sawflies are listed.

Key words – Fauna Hungariae, compilation, host plant records

INTRODUCTION

The presented list of host plants and their associated species of Hymenoptera formerly frequently placed into the paraphyletic group Symphyta (sawflies and their allies), inspired by ENSLIN (1918), is a compilation based predominantly on the author's handbooks published in the book series Fauna Hungariae (MÓCZÁR & ZOMBORI 1973, ZOMBORI 1982, 1990, 2016, 2022a). Nevertheless, the works of TAEGER *et al.* (1998), ROLLER & HARIS (2008), and ZOMBORI (2022b, 2023) were also considered. The author made similar attempts in the indices of his latest issues of Fauna Hungariae (ZOMBORI 2016, 2022a) by listing the host plants and sawflies. Some host plant associations of certain sawfly species were not indicated in issues of Fauna Hungariae, but only in two recent works by ZOMBORI (2022b, 2023); those are marked with an asterisk (*) within the list.

Nomenclature of sawflies follows the above-mentioned sources. The tribe Nematini (Tenthredinidae) is excluded due to the fact that the pertaining genera have not been treated in the author's Fauna Hungariae handbooks. The family Orussidae is also omitted due to the parasitic lifestyle of its members.

Nomenclature of host plants follows mainly SOÓ & KÁRPÁTI (1968), with some necessary updates based on Euro+Med PlantBase*. In several cases only genus- (or rarely only family-) group names of host plants are given, indicating

the lack of more precise identity of the host plant. It is worth noting that host plant taxa include native and non-native, cultivated species (either for food or ornamental purposes). Some listed plant taxa are quite rare in Hungary, but are more common not far from the present borders of the country; following the principles of the author's issues published in *Fauna Hungariae* (MÓCZÁR & ZOMBORI 1973, ZOMBORI 1982, 1990, 2016, 2022a), these are also considered if previous literature data confirmed the association with sawfly species present in Hungary. Taxa are listed in alphabetic order by host plants; their associated sawflies are also listed alphabetically.

The known host plant associations of sawflies, listed by the host plants, may help the identifications of sawflies, especially their larvae collected from the host plants.
